

Day 43

“CLOUD SECURITY”

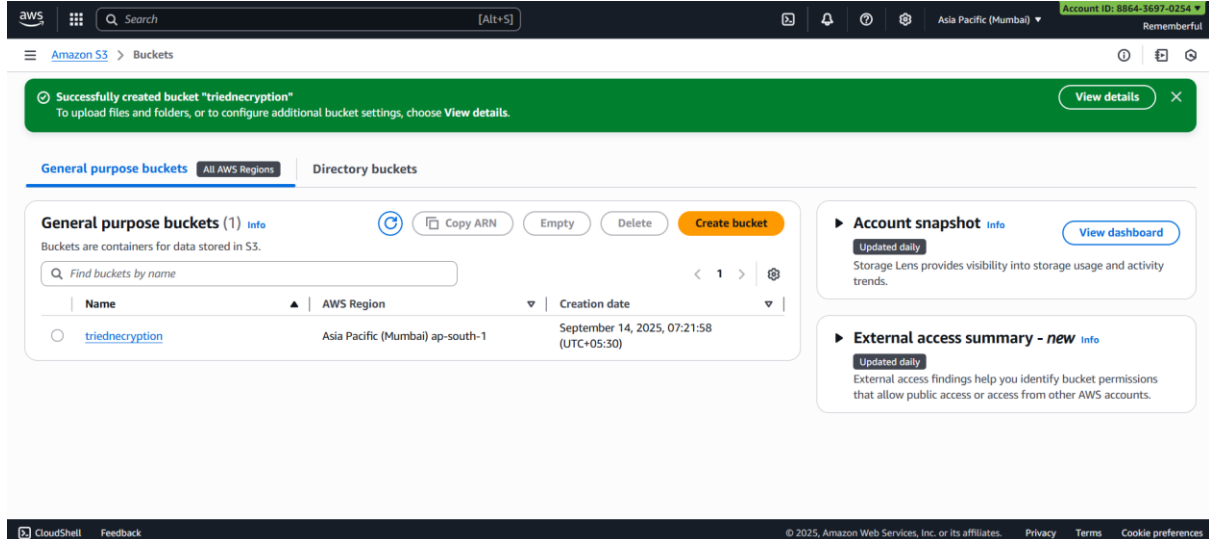

Enable Amazon S3 Default Encryption:

Steps:

Look for S3:

Select the bucket you want to encrypt:

Open the bucket:

The screenshot shows the AWS console interface for the 'triednecryption' bucket. The 'Properties' tab is selected, displaying the following information:

- Bucket overview:**
 - AWS Region: Asia Pacific (Mumbai) ap-south-1
 - Amazon Resource Name (ARN): arn:aws:s3::triednecryption
 - Creation date: September 14, 2025, 07:21:58 (UTC+05:30)
- Bucket Versioning:** Disabled. An 'Edit' button is visible.
- Multi-factor authentication (MFA) delete:** Disabled. A 'Learn more' link is present.
- Tags (0):** No tags are associated with this resource. An 'Edit' button is visible.

Scroll down to “Default Encryption:

The screenshot shows the 'Default encryption' section of the bucket's properties. It indicates that server-side encryption is automatically applied to new objects. The 'Encryption type' is set to 'Server-side encryption with Amazon S3 managed keys (SSE-S3)'. The 'Bucket Key' is also 'Enabled'. Below this, there is a section for 'Intelligent-Tiering Archive configurations (0)', which is currently empty.

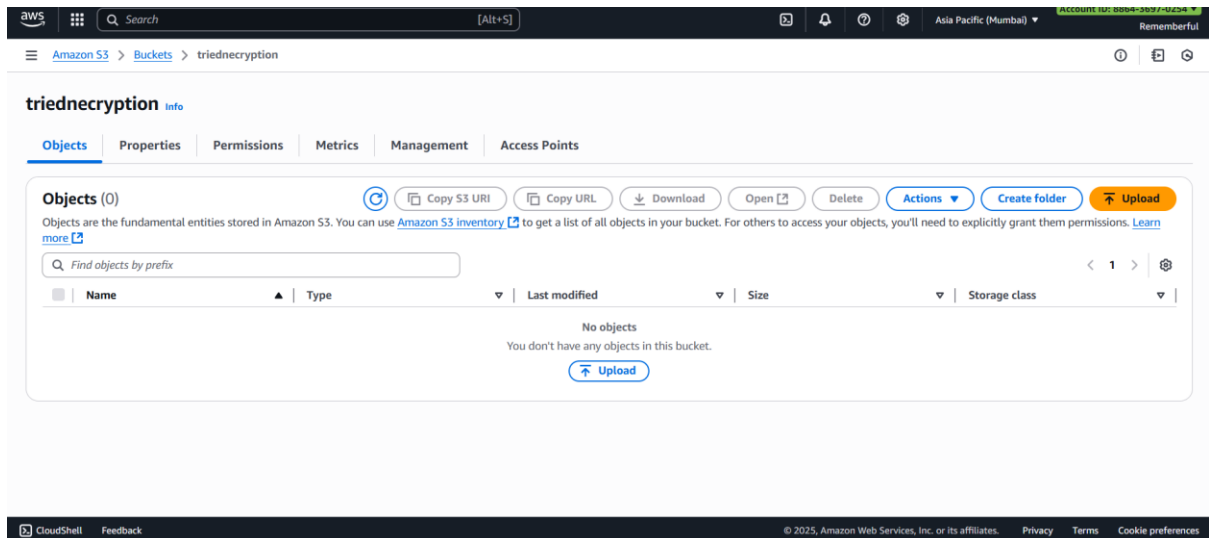

Click on “edit” button: following screen will appear

The screenshot shows the 'Edit default encryption' screen. It allows you to modify the default encryption settings for the bucket. The 'Encryption type' is currently set to 'Server-side encryption with Amazon S3 managed keys (SSE-S3)'. The 'Bucket Key' is also set to 'Enable'. At the bottom, there are 'Cancel' and 'Save changes' buttons.

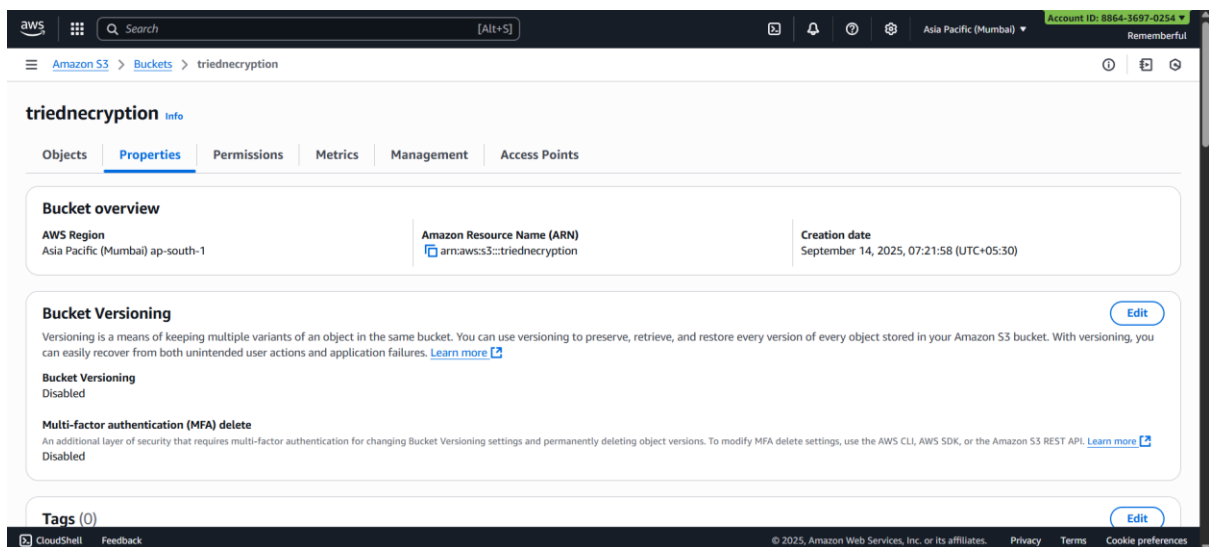

Enable Server Access Logging for Amazon S3 Bucket:

Steps:

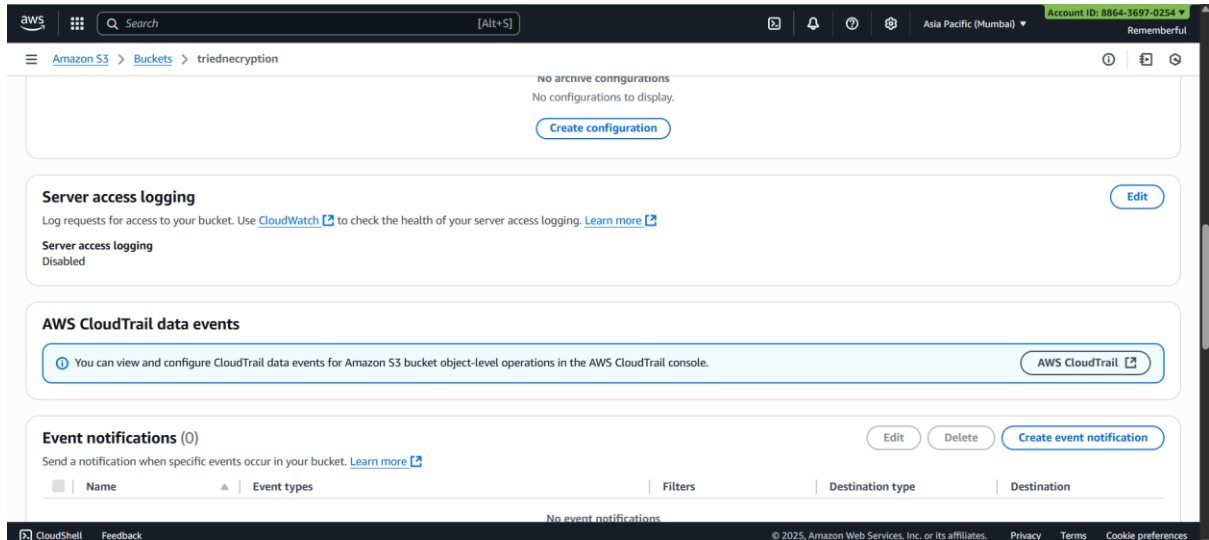

Open the bucket:

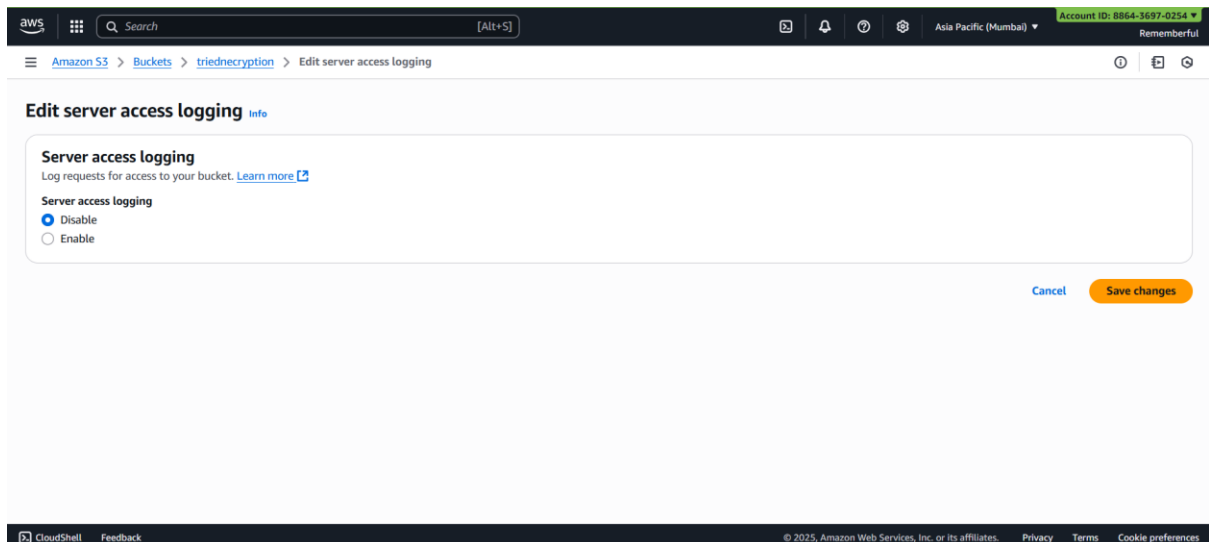

Go to “Properties” Section;

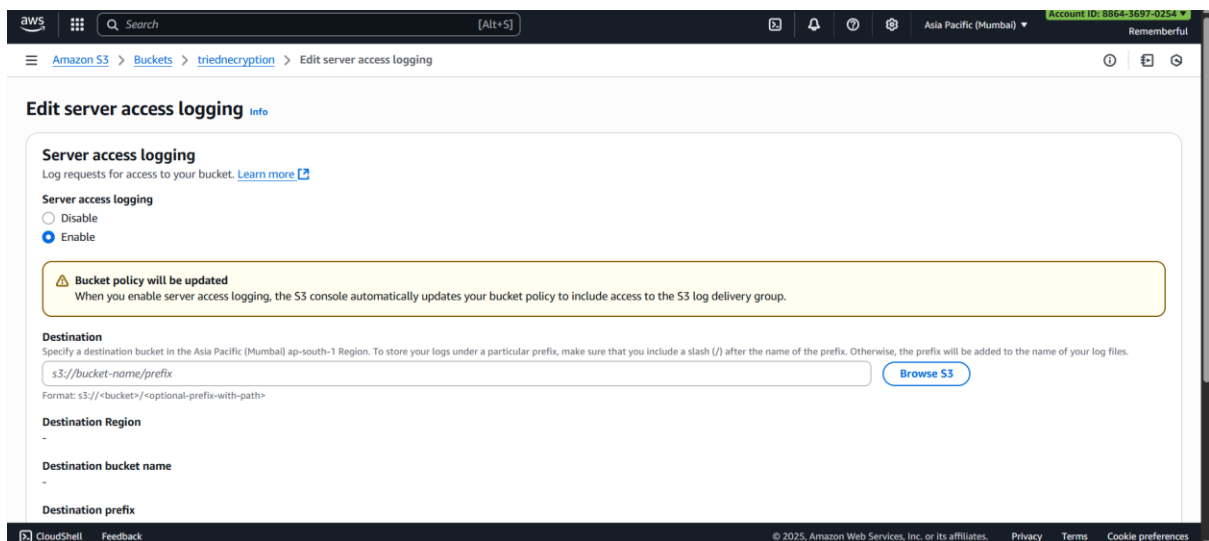

Scroll down to “Server access logging”:

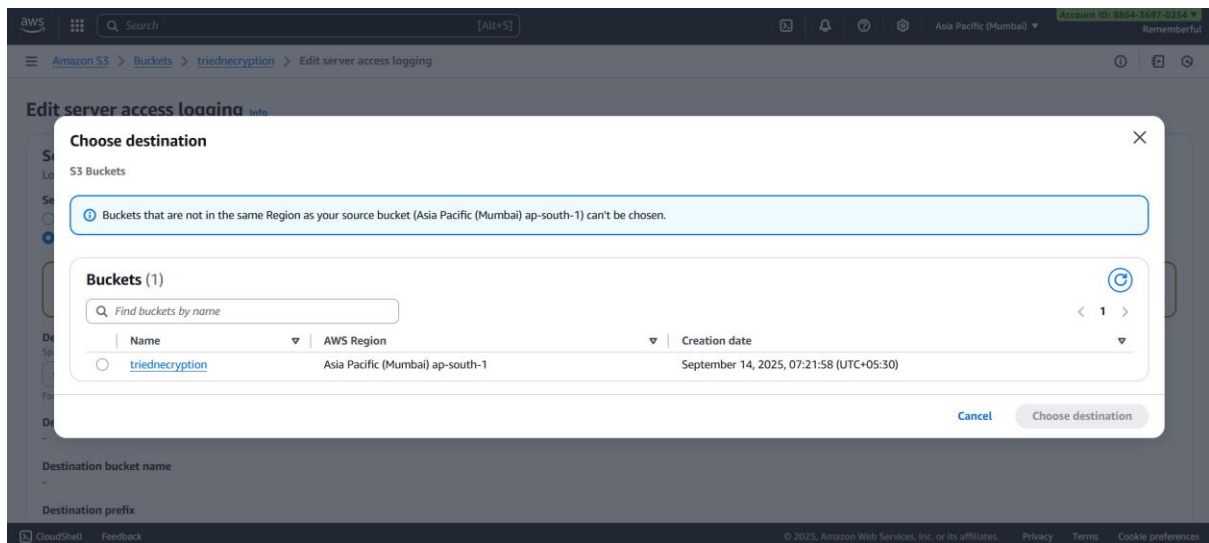

Click on “edit” button: following screen will appear

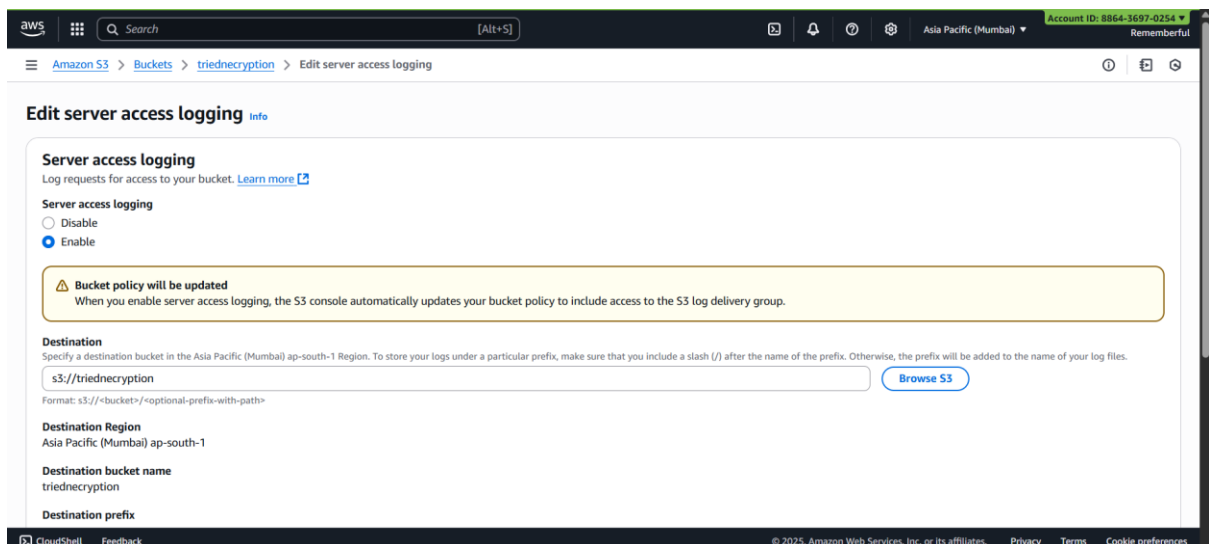

Click on “enable” button: following options will appear

Browse S3:

Select the bucket:

Click on the orange button at bottom, following confirmation will occur:
